2.1.2: I think that Mr. "I am the one who knows everything" is trying to leave computer science behind. People "knowing everything" is the frontier that any other, particularly any software developer, are not going to do. Can you tell me how to tell from the API that it's running on a Windows Server 2012 vs Windows Server 2008/2008r2 machine? I am trying to determine what version of .NET to run, and I found this: But I don't know how to distinguish between these. Any help would be greatly appreciated. A: Following the link you

provided in your comments (I'll get back to that later), a quick look at the file at the location that you referenced, Microsoft.Office.Server.Apps.Core.dll, gives you the following information

Can there be a relative risk exceeding one? From time to time I am studying statistics and I do not understand that in this case the risk ( $\lambda$ ) can be greater than one. I know that the event being greater than a certain probability ( $1/2, 1/3, 1/n$ ) can be greater than probability ( $1/2, 1/3, 1/n$ ) (referenced below). I understand intuitively why this can happen, but I do not understand how the process works.

A: You will find your answer in the same textbook as the quote below, it is simply

---

a combination of two independent events not (necessarily) of the same probability.

If the first event has a probability  $1/2$  and the second event has a probability of  $0.8$ , then the combined probability that the first is greater than the second is  $0.52 * 0.8 = 0.424$ . Just like you can combine independent events, you can have a combination of two events that have a probability of not being less than 1, by drawing from the chi-squared distribution with 2 degrees of freedom and a threshold of 1. For example a group with a frequency of  $4.7\%$  in a population with a frequency of  $50\%$  gets the chi-squared statistic of  $11.6$ . We can calculate the p-value as:  $1 - P(\text{chi-}$

---

squared > 11.6) = 1 - P(chi-squared > (11.6 - 4.7)/2, df=2) = 1 - P(X<sup>2</sup> > 2.2766) = 1 - P(X<sup>2</sup> > 0.4838) = 1 - P(X<sup>2</sup> > 0.4211) = 1 - 0.99981 = 0.00019 The p-value above is statistically significant at the alpha level of 0.05. 6a5afdab4c

From Wikipedia, the free encyclopedia Jump to: navigation, search The term Blu-ray was originally applied to a specific standard for optical discs developed by Sony and later adopted by the Blu-ray Disc Association (BD-Association). The BD-Association was founded by Sony and six other companies. The technology was designed to store much higher-

---

quality video content than the DVD format, including HDTV video. The BD-Association promoted the Blu-ray Disc as being more than just a large capacity disc, but a "next generation" optical disc solution that combined several advantages: enough capacity to store HD video and enough data bandwidth to enable interactive services that were not possible on DVD. Another part of the Blu-ray specification is the Blu-ray Disc Rewritable (BD-RW) format,
